

*SPECIFICATION AMENDMENTS*

Replace the paragraph beginning at page 5, line 17 with

The contact levers 30 are supported by the switching member 50 for movement thereby, bridging horizontally across the legs 54. Each of the contact levers 30 has opposite ends 32 arranged to come into contact with and out of contact from the upper ends 22 of a corresponding pair of the contact strips 20 below it, for switching the load on and off. The contact lever 30 is resiliently biassed downwards by a respective coil spring 70 at mid-length, for bearing against the associated contact strips [[22]] 20 when the switching member 50 is sufficiently lowered.
